

Executive summary example

Example context. This teaching example answers the hypothetical prompt below. For your Project 1 submission, choose one of the two business objectives in the project instructions.

Hypothetical prompt. iFood wants to reactivate customers who have not purchased for more than 60 days. Use customer profiles and past product spending to recommend an initial campaign audience and a test of a reactivation offer.

Business objective

iFood needs to decide whom to include in a campaign that encourages inactive customers to purchase again. I recommend testing a reactivation offer among customers with high past spending before expanding the campaign.

Approach

I examined all 2,240 customers, defining inactivity as no purchase for more than 60 days. I compared customer profiles, complaint status, and enrollment groups, then used recorded product spending over the past two years to identify an initial test audience.

Key findings and implications

The file contains 862 inactive customers (38.5%). Broad birth-cohort and income comparisons offer no clear demographic targeting rule. Some smaller groups have higher rates, but limited counts make these weak foundations for a campaign.

Of the inactive customers, 224 fall in the highest-spending quarter of the full customer file. They represent 26.0% of the inactive audience and account for 62.6% of its recorded product spending. This concentration makes them a practical initial test group; it does not establish that they will respond best or be most profitable.

Recommendation

Run a randomized pilot among the 224 inactive high-spending customers, comparing an offer group with a no-offer group. Track purchases over the following 30 days. If budget permits, run a comparable test among the other 638 inactive customers. Collect the cost, margin, and follow-up purchase data needed to decide whether to expand either audience.
